

# Computational Models of Constraint Propagation

Alexander V. Konstantinou  
Columbia University

Candidacy Exam  
December 9th, 1999

## Presentation Overview

- Introduction
- Constraint Propagation (5)
- Constraint Logic Programming (3)
  - Interval Propagation (2)
- Algorithms (6)
- Systems (6)
- Future Work

December 9th, 1999

Alexander V. Konstantinou

2

## Constraint Example

- Color flag (red, white)
- Maple leaf is red
- Neighbors have different colors

Variables : X, Y, U, Z

Domains :  $D_X = D_Y = D_U = D_Z = \{ \text{white, red} \}$

Constraints : (1)  $U = \text{red}$  (3)  $X \neq Y$   
(2)  $Y \neq U$  (4)  $U \neq Z$

3

## Formal CSP Definition

- *Constraint* is a relation over some domain  $D$
- *Constraint graph*  $G = \langle C, V, D \rangle$
- *Valuation*  $\theta$  function ( $v \in V$ )  $\rightarrow$  elements of  $D$
- *Solution*  $S$  is set of all valuations satisfying all  $C$

E.g.,  $G = \langle \{ c * 1.8 = f - 32 \}, \{ c, f \}, R \rangle$   
 $\theta = \{ c, f \mid 0.0, 32.0 \}$   
 $S = \{ \{ c, f \mid 0.0, 32.0 \}$   
 $\{ c, f \mid -40.0, -40.0 \} \dots \}$

December 9th, 1999

Alexander V. Konstantinou

4

## Constraint Graph Representation

*N-ary constraints*

*Binary constraints*

- How are constraints evaluated ?
- $F = (5/9)*C + 32$  methods : (multi-way constraint)
  - $F := (5/9)*C + 32$
  - $C := (9/5)*(F - 32)$

December 9th, 1999

Alexander V. Konstantinou

5

## Constraint Satisfaction

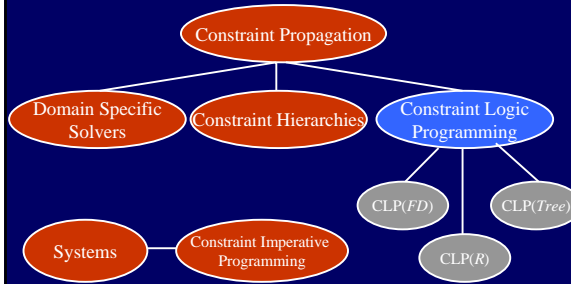

- Generate & Test (NP)
- Local Propagation (P)
  - No cycles (simultaneous equations)
  - No partial information constraints (greater-than)
- Search (NP)
  - E.g., Backpropagation + local propagation
- Domain-specific algorithms (P/NP)
  - E.g., Gaussian elimination (integers)

December 9th, 1999

Alexander V. Konstantinou

6

## Constraint Research

December 9th, 1999

Alexander V. Kostantinou

7

## Local Propagation

- Data-flow phases :
  - Determine variable value using constraint
  - Use value in another constraint, determine new variable value
- Handles non-numeric constraints
- Does not handle:
  - Cycles (simultaneous equations) — Is not complete
  - Partial information constraints (greater-than)

December 9th, 1999

Alexander V. Kostantinou

8

## Backtracking + Propagation

[Mackworth 1977, Mohr 1986]

- Node  $V_i$  is **node consistent** iff
  - $\forall x \in D_i, C_i(x)$
- Arc  $(i,j)$  is **arc consistent** iff
  - $\forall x \in D_i, C_i(x) \exists y \in d_j, C_j(y) \wedge C_{ij}(x, y)$
- Path  $(i_0, i_1, \dots, i_m)$  is **path consistent** iff
  - $\forall x \in D_{i_0}, y \in D_{i_m}, C_{i_0}(x) \wedge C_{i_m}(y) \wedge C_{i_0 i_m}(x, y)$   
 $\exists z_1 \in D_{i_1}, \dots, z_{m-1} \in D_{i_{m-1}} :$ 
    - $C_{i_1}(z_1) \wedge \dots \wedge C_{i_{m-1}}(z_{m-1})$
    - $C_{i_0 i_1}(x, z_1) \wedge C_{i_1 i_2}(z_1, z_2) \wedge \dots \wedge C_{i_{m-1} i_m}(z_{m-1}, y)$

9

## Spreadsheet Model [Zanden92]

- Active-value-spreadsheet model
  - allow side-effects during constraint solving
  - solver decides ordering
  - cycle handling
- Procedures help solver
  - gain in efficiency
  - increase program complexity

December 9th, 1999

Alexander V. Kostantinou

10

## Constraint Hierarchies

- Overconstrained/underconstrained problems
- Which variables to alter to satisfy multi-way constraints ?
  - E.g., change IP host address, or renumber whole network ?
- Constraint Hierarchies :
  - Labeled constraints (strength  $[0 \dots m]$ )
  - Comparators (**locally-better**/globally-better)
  - Weights
  - Annotations (read/write only)

December 9th, 1999

Alexander V. Kostantinou

11

## Constraint Logic Programming

## Constraint Logic Programming

[Cohen90]

- The equality “ $1 + X = 3$ ” fails in Prolog
  - Symbol ‘+’ considered unevaluated and unification fails
- Workarounds exist (use successor, or “is”)
- Solution: replace unification by constraints
- ...

```

solve([], C, C)
solve(Goal|Restgoal, Previous_C, New_C) :-
    solve(Goal, Previous_C, Temp_C),
    solve(Restgoal, Temp_C, New_C).
solve(Goal, Previous_C, New_C),
    clause(Goal, Body, Current_C),
    merge_constraints(Previous_C, Current_C, Temp_C),
    solve(Boddy, Temp_C, New_C).
    
```

13

## Expressive Power [Mackworth92]

First Order Predicate Calculus (FOPC)

December 9th, 1999

Alexander V. Konstantinou

14

## Algorithms

## Incremental Local Propagation

(DeltaBlue) [Gagnet92]

- Local propagation
- No cycles
- One-way constraints
- Incremental
- Handles constraint hierarchies
- Maintains solution graph
- Separates planning from evaluation
- $O(M*N)$  |  $N$  constraints,  $M$  max methods/constr.
- Implemented in various systems

December 9th, 1999

Alexander V. Konstantinou

16

## Multi-way Propagation (SkyBlue)

[Sannella, 1994]

- General solver (methods)
- Incremental
- Cycle-aware
- Selects method, constructs directed method graph

$C = A + B$ 
 $C := A + B$   
 $B := C - A$   
 $A := C - B$

December 9th, 1999

Alexander V. Konstantinou

17

## Pointer Variables [Zanden, 1994]

- $node.value \geq node.prev.value$
- Incremental algorithms (lazy/eager)
- Dependency graph based nulification/reevaluation
- Timestamps to support changing references **during** constraint evaluation
- One-way constraints
- Handles cycles
- $O(|affected|)$

December 9th, 1999

Alexander V. Konstantinou

18

## Inequality Constraints (Indigo)

[Borning, 1996]

$C = A + B$   
 $10 \leq A \leq 20$   
 $30 \leq B \leq 40$

$A.tighten(C.bounds - B.bounds)$   
 $B.tighten(C.bounds - A.bounds)$   
 $C.tighten(A.bounds + B.bounds)$

$A [10, 20]$   
 $B [30, 40]$   
 $C [40, 60]$

- Acyclic graph
- Initially  $[-\infty, +\infty]$
- Problem: division by zero
- Issue: single vs. multiple intervals
- Process strongest to weakest
- $O(n*m)$  |  $n$ : variables,  $m$ : constraints
- One var. tightening per constraint (acyclic)

December 9th, 1999

Alexander V. Konstantinou

19

## Interval Propagation [Davis87, Hyvönen92]

- Label refinement (Waltz)
- Deductively sound
- Finite set  $O(a^*e)$  |  $a$ : domain size,  $e$ : constraints
- Label languages, constraint languages,

December 9th, 1999

Alexander V. Konstantinou

20

## Systems & Constraint Imperative Programming

## Constraints + Object-Orientation

[Wilk91, Benson92, Lopez94]

- Goals :
  - Preserve flexibility of modern OO languages
  - Constraints on object methods
  - Maintain imperative OO style
  - Solve useful collections of constraints
  - Use refinement method (v.s. perturbation)

December 9th, 1999

Alexander V. Konstantinou

22

## Constraints + Object-Orientation

[Avesani90, Wilk91, Benson92, Lopez94]

- Integration Options:
  - Local propagation (known issues)
  - Constraints on primitive leaves [Avesani90]
  - New constraint solvers (per domain)
  - Graph rewriting [Wilk91]
  - Constraint constructors [Benson92]
  - Other
    - E.g., local propagation + iterative relaxation

December 9th, 1999

Alexander V. Konstantinou

23

## Kaleidoscope'91 [Benson92]

- New OO language (multiple dispatching)
- Types as constraints
- Time & Assignment
  - Pellucid values (keeps current, previous)
  - Assignment: once constraint + weak stay
- Constraint constructors
  - Dispatch on each operator (no side effects)

December 9th, 1999

Alexander V. Konstantinou

24

## Future Work

## Constraints & Network Mgmt

- Object-relationship configuration model
- Under-constrained system
- Policy directed change propagation
- Domains : integers, strings, relations
- Constraints : equality, interval, set membership, ...
- Expressing constraints & propagation policies
  - Graphical language ?

December 9th, 1999
