Presentation Outline

- Introduction/Overview
- Architecture
- Infrastructure
- Programmatic Interface
- JavaSpaces
- Summary

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

What is Jini ?

- New distributed system architecture
- Sun R&D project inspired by Bill Joy
- Goal to simplify interaction with networks
- Built around model of clients looking for services
- Plug-and-participate (spontaneous networking)
- New class of network services

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Why Change ?

Jini Evangelism Section

What has changed in the picture ?

*“Windows NT is 16.5 million lines
of code that will never be debugged”*

-- Bill Joy

Why Jini ?

Jini Evangelism Section

- You are the new system administrator,
- Computers are nowhere,
- The one computer is everywhere !

- Networks are becoming ubiquitous
- Consumer electronics devices are getting smarter
- Current networks rely on static configuration and are hard to administer

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Jini thinks “*Services*”

- Jini members **federate** to share access to services
- A **service** is an entity that may be used by a *person*, a *program* or *another service*
- A **service** may be a *computation*, *storage*, a *communication* channel, a software *filter*, a hardware *device*, or another *user*
- Services are **composed** for performance of a particular task

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Key Concepts

- **Federating** groups of devices and software components into single distributed system
- Single Jini system targeted to **workgroup**
- **Members** of federation agree on basic notions of trust, administration, identification and policy
- It is possible to **federate Jini systems** for larger organizations

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Jini Environment

- Entertainment devices will continue to increase their “**digital component**”
- Existence of **network** of reasonable speed ($\geq 10\text{Mbps}$)
- Devices have some **memory & processing** power.
 - *Proxies* provided for “dumb” devices
- **Java-technology centered** : bytecode everywhere

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Base Java Features

- Java **byte-code** is platform independent
 - Other languages may be compiled to byte-code (Ada)
- Java objects may be *serialized* into stream of bytes
 - Lack of pointers & strong typing allows for deep-copy
 - Mobile objects : code + data saved as a byte-stream
- Java **RMI** (Remote Method Invocation)
- Java **security** model - beyond the sandbox
 - Signed applications + domain-based access control

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Architecture

- Jini *infrastructure* :
 - Discovery and Join
 - Lookup
- Jini *services* :
 - JavaSpaces
- *Programming model* :
 - Leasing, Transactions, Distributed Events

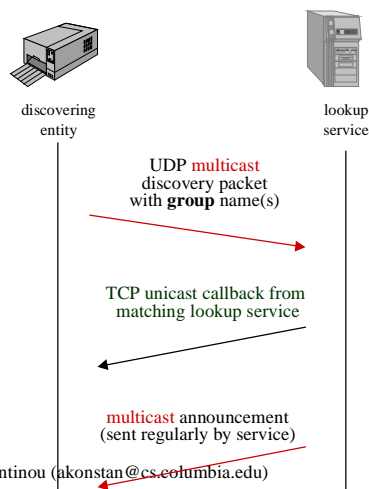

Extremely light-weight : Jini classes take 48Kb

Jini Infrastructure

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Discovery

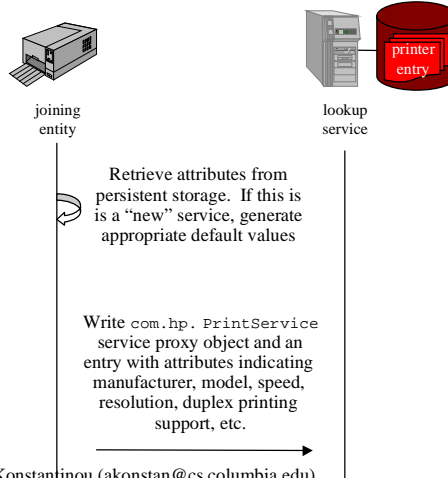

- Host requirements :
 - functioning JVM
 - configured network stack
- IP stack requirements :
 - IP address
 - unicast TCP, multicast UDP
 - RMI stub export mechanism (e.g. HTTP)
- **Group** : an arbitrary string that acts as a name (recommend DNS names eng.sun.com)
 - initially empty (new service)

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Join

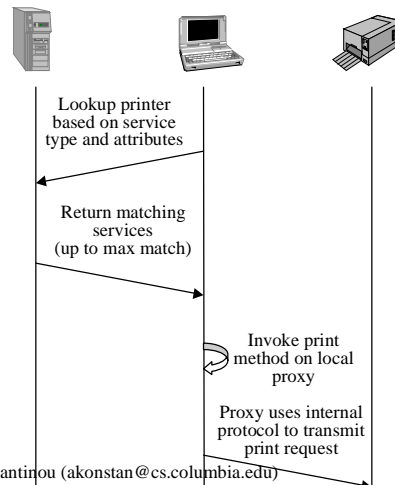

- Register with each lookup service discovered
- Persistent state :
 - Service ID
 - Lookup entry
 - Groups
 - Lookup services

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Lookup

- Lookup service maintains flat collection of *service items*
- Items contain the RMI stub or proxy object used to access the service + an extensible collection of descriptive **attributes**
- Entries may be manipulated graphically by administrator (JavaBeans)

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Entry

- An **entry** is a class containing a number of public fields of object type
- Service may provide **multiple** entries (set of sets)
- **Exact** lookup semantics
- Design issues :
 - matching cannot always be *automated* (reduce)
 - attributes are mostly *static* (order of minutes)
 - *humans* need to understand most attributes
 - attributes can be changed by services or humans, but *not both*
 - attributes must interoperate with *JavaBeans* components

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Programmatic Interface

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Distributed Leasing

- **Failures** in distributed systems result in unbounded resource consumption growth
- Services in Jini are **leased** based on time
- Jini provides a simple **interface** for requesting, renewing, and canceling a lease
- Lease time may be **absolute** or **durational**

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Distributed Events

- Remote events contain : *source*, *event ID*, *sequence number*, and *hand-back object*
- Notification of remote event may **fail** (Exception)
- Remote event registration is **leased**
- **Third party objects** may act as filters/proxies :
 - Store-and-forward agents (offload generator object)
 - Notification Filters (offload receivers)
 - Notification Mailboxes (offline receipt)

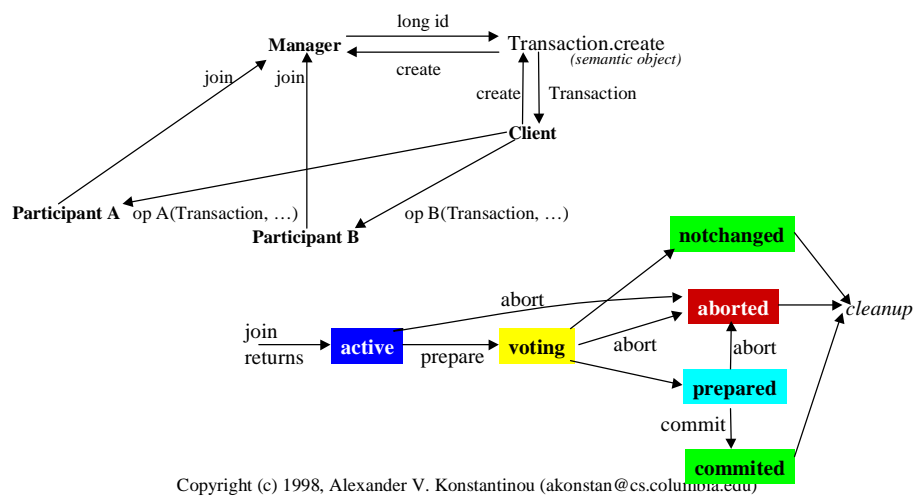

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Transactions

- Provides **coordination mechanism** (API) for performing a distributed two-phase commit
- No monitors: **objects responsible** for correct implementation
- Transaction created and overseen by *manager*
- Semantics represented by *semantic objects*
- Default action semantics preserve *atomicity, consistency, isolation, and durability*

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Transactions (cont.)

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

JavaSpaces

- Distributed algorithms as **flows of objects**
- JavaSpaces implementations provide reliable distributed **storage** for objects
- JavaSpaces store **Entries** with public fields
- Field **lookup** is exact match or don't care
- Operations : *write, read, take, notify*
- Entries written into JavaSpace are leased
- Operations may be part of distributed transaction

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Open Issues

- Network infrastructure : DHCP, Multicast
- Schema standardization/evolution
- Embedded Java future
- Adoption by device manufacturers
- Jini v.s. directory-based approaches

Copyright (c) 1998, Alexander V. Konstantinou (akonstan@cs.columbia.edu)

Summary

- Jini challenges the predominant (PC) network and computer architecture.
- Killer App ?
 - Home network
 - Mobile computing : navigating both local & home-base environment
 - Robust computing : service (object) redundancy
- Programming model may survive independently
- Mirror worlds ?
