Introduction	Literature Survey	Our Data	Resources	Models 000	Results 0000	Future work	Conclusion
Our Data							

- 11,875 manually annotated tweets from a commercial source
- Collect a stream of tweets; translate tweets in foreign language using Google translator; randomly select tweets and annotate them for {*junk*, +, -, *o*}
- Ignore *junk* tweets. Leaves us with 8,753 tweets
- Use stratified sampling to get a balanced data-set of 5127 tweets (1709 each of +, -, o)

● Emoticon→polarity dictionary: manually assign polarity to 170 emoticons from Wikipedia

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

• Emoticon→polarity dictionary: manually assign polarity to 170 emoticons from Wikipedia

• Acronym dictionary (noslang.com): *lol* = laugh out loud

- Emoticon→polarity dictionary: manually assign polarity to 170 emoticons from Wikipedia
- Acronym dictionary (noslang.com): *lol* = laugh out loud
- Dictionary of Affect in Language (DAL, Whissel 1989): prior polarity lexicon

- Emoticon→polarity dictionary: manually assign polarity to 170 emoticons from Wikipedia
- Acronym dictionary (noslang.com): *lol* = laugh out loud
- Dictionary of Affect in Language (DAL, Whissel 1989): prior polarity lexicon
- WordNet: for increasing the coverage of DAL (Agarwal et. al. 2009)

- Emoticon→polarity dictionary: manually assign polarity to 170 emoticons from Wikipedia
- Acronym dictionary (noslang.com): *lol* = laugh out loud
- Dictionary of Affect in Language (DAL, Whissel 1989): prior polarity lexicon
- WordNet: for increasing the coverage of DAL (Agarwal et. al. 2009)

Pre-processing

• Convert emoticons to polarity tags: positive emoticons = ||P||

- Convert all URLS to tag ||U||
- Convert all target mentions to ||T||
- Convert *cooooool* to *coool*

Introduction	Literature Survey	Our Data	Resources	Models ●○○	Results 0000	Future work	Conclusion
Models							

Two types of models:

• Tree kernels: represent tweets as trees encoding bag-of-words, POS tags, prior polarity scores of words (minimal feature engineering required)

<□▶ < @ ▶ < E ▶ < E ▶ E のへぐ

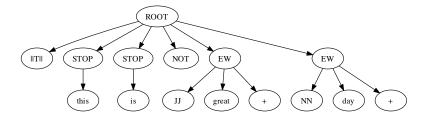

Introduction	Literature Survey	Our Data	Resources	Models ●○○	Results 0000	Future work	Conclusion
Models							

Two types of models:

- Tree kernels: represent tweets as trees encoding bag-of-words, POS tags, prior polarity scores of words (minimal feature engineering required)
- Explicit feature engineering based model (Senti-feature model)

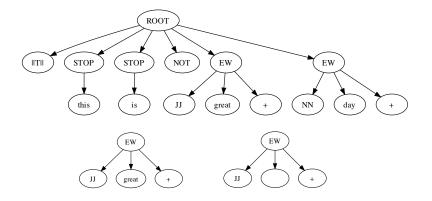

@Fernando this isn't a great day

@Fernando this isn't a great day

• Non-polar: count of POS tags, acronyms, dictionary words, URLs, hashtags, newlines, % capitalized words, presence of exclamation marks and capitalization

- Non-polar: count of POS tags, acronyms, dictionary words, URLs, hashtags, newlines, % capitalized words, presence of exclamation marks and capitalization
- Polar POS: For each POS (JJ, RB, VB, NN)
 - # of +/- words with that POS
 - Summation of prior polarity scores of words with that POS

- Non-polar: count of POS tags, acronyms, dictionary words, URLs, hashtags, newlines, % capitalized words, presence of exclamation marks and capitalization
- Polar POS: For each POS (JJ, RB, VB, NN)
 - # of +/- words with that POS
 - Summation of prior polarity scores of words with that POS
- <u>Polar Other</u>: # of negation words, +/- words, +/- emoticons, +/- hashtags, summation of prior polarity scores of all the words

(Use Stanford tokenizer and POS tagger)

Introduction	Literature Survey	Our Data	Resources	Models 000	Results 0000	Future work	Conclusion
Future W	ork						

• Study the affect of using different dictionaries (acronym, emoticon, DAL)

(ロト (個) (E) (E) (E) (O)

Introduction	Literature Survey	Our Data	Resources	Models 000	Results 0000	Future work	Conclusion
Future W	ork						

- Study the affect of using different dictionaries (acronym, emoticon, DAL)
- Explore other linguistically rich features: dependency trees, FrameNet, Verbnet

< ロ > < 団 > < 豆 > < 豆 > < 豆 > < 豆 > < 豆 < つ < ○

Introduction	Literature Survey	Our Data	Resources	Models 000	Results 0000	Future work	Conclusion
Future W	ork						

- Study the affect of using different dictionaries (acronym, emoticon, DAL)
- Explore other linguistically rich features: dependency trees, FrameNet, Verbnet
- Tree kernels seem to encode many more features but their performance is a little less than feature extraction methods (same observation in relation extraction)

Introduction	Literature Survey	Our Data	Resources	Models 000	Results 0000	Future work	Conclusion
Conclusio	on

• Proposed two models for sentiment analysis of twitter

Introduction	Literature Survey	Our Data	Resources	Models 000	Results 0000	Future work	Conclusion
Conclusio	on						

- Proposed two models for sentiment analysis of twitter
- On both 2-way and 3-way classification tasks beat the baseline model by over 4%

▲□▶▲□▶▲□▶▲□▶ □ ● ● ●

Introduction	Literature Survey	Our Data	Resources	Models 000	Results 0000	Future work	Conclusion
Conclusio	on						

- Proposed two models for sentiment analysis of twitter
- On both 2-way and 3-way classification tasks beat the baseline model by over 4%

• Make available two new resources for the task: Acronym dictionary, Emoticon to polarity dictionary

Introduction	Literature Survey	Our Data	Resources	Models 000	Results 0000	Future work	Conclusion
Conclusion							

- Proposed two models for sentiment analysis of twitter
- On both 2-way and 3-way classification tasks beat the baseline model by over 4%
- Make available two new resources for the task: Acronym dictionary, Emoticon to polarity dictionary
- No matter how noisy and non-standard English the data might seem at first, there is hope for being able to use linguistically rich resources/features
