Computer Graphics (Fall 2005)

COMS 4160, Lecture 3: Transformations 1 http://www.cs.columbia.edu/~cs4160

To Do

- Start (thinking about) assignment 1
 - Much of information you need is in this lecture (slides)
 - Ask TA NOW if compilation problems, visual C++ etc.
 - Not that much coding [solution is approx. 20 lines, but you may need more to implement basic matrix/vector math], but some thinking and debugging likely involved
- Specifics of HW 1
 - Axis-angle rotation and gluLookAt most useful (essential?). These are not covered in text (look at slides).
 - You probably only need final results, but try understanding derivations.
- Problems in text help understanding material. Usually, we have review sessions per unit, but this one before midterm

Motivation

- Many different coordinate systems in graphics
 World, model, body, arms, ...
- To relate them, we must transform between them
- Also, for modeling objects. I have a teapot, but
 - Want to place it at correct location in the world
 - Want to view it from different angles (HW 1)
 - Want to scale it to make it bigger or smaller

Motivation

- Many different coordinate systems in graphics
 - World, model, body, arms, ...
- To relate them, we must transform between them
- Also, for modeling objects. I have a teapot, but
 - Want to place it at correct location in the world
 - Want to view it from different angles (HW 1)
 - Want to scale it to make it bigger or smaller
- This unit is about the math for doing all these things
 - Represent transformations using matrices and matrix-vector multiplications.
- Demo: HW 1, applet <u>transformation game.jar</u>

General Idea

- Object in model coordinates
- Transform into world coordinates
- Represent points on object as vectors
- Multiply by matrices
- Demos with applet
- Chapter 6 in text. We cover most of it essentially as in the book. Worthwhile (but not essential) to read whole chapter

Outline

- 2D transformations: rotation, scale, shear
- Composing transforms
- 3D rotations
- Translation: Homogeneous Coordinates (next time)
- Transforming Normals (next time)

(Nonuniform) Scale

$$Scale(s_{x}, s_{y}) = \begin{pmatrix} s_{x} & 0 \\ 0 & s_{y} \end{pmatrix} \qquad S^{-1} = \begin{pmatrix} s_{x}^{-1} & 0 \\ 0 & s_{y}^{-1} \end{pmatrix}$$
$$\begin{pmatrix} s_{x} & 0 & 0 \\ 0 & s_{y} & 0 \\ 0 & 0 & s_{z} \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} s_{x}x \\ s_{y}y \\ s_{z}z \end{pmatrix}$$

transformation game.jai

Shear

Shear =
$$\begin{pmatrix} 1 & a \\ 0 & 1 \end{pmatrix}$$
 $S^{-1} = \begin{pmatrix} 1 & -a \\ 0 & 1 \end{pmatrix}$

Rotations

2D simple, 3D complicated. [Derivation? Examples?]

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

- Linear R(X+Y)=R(X)+R(Y)
- Commutative

transformation game iar

Outline

- 2D transformations: rotation, scale, shear
- Composing transforms
- 3D rotations
- Translation: Homogeneous Coordinates
- Transforming Normals

Composing Transforms

- Often want to combine transforms
- E.g. first scale by 2, then rotate by 45 degrees
- Advantage of matrix formulation: All still a matrix
- Not commutative!! Order matters

E.g. Composing rotations, scales

$$x_3 = Rx_2 x_2 = Sx_1$$

$$x_3 = R(Sx_1) = (RS)x_1$$

$$x_3 \neq SRx_1$$

transformation game iar

Inverting Composite Transforms

- Say I want to invert a combination of 3 transforms
- Option 1: Find composite matrix, invert
- Option 2: Invert each transform *and swap order*
- Obvious from properties of matrices

$$M = M_1 M_2 M_3$$

$$M^{-1} = M_3^{-1} M_2^{-1} M_1^{-1}$$

$$M^{-1} M = M_3^{-1} (M_2^{-1} (M_1^{-1} M_1) M_2) M_3$$
transformation, while far

Outline

- 2D transformations: rotation, scale, shear
- Composing transforms
- 3D rotations
- Translation: Homogeneous Coordinates
- Transforming Normals

Rotations

Review of 2D case

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

• Orthogonal?, $R^T R = I$

Rotations in 3D

Rotations about coordinate axes simple

$$R_{z} = \begin{pmatrix} \cos\theta & -\sin\theta & 0 \\ \sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{pmatrix} \qquad R_{x} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta \\ 0 & \sin\theta & \cos\theta \end{pmatrix}$$

$$R_{y} = \begin{pmatrix} \cos\theta & 0 & \sin\theta \\ 0 & 1 & 0 \\ -\sin\theta & 0 & \cos\theta \end{pmatrix}$$

Always linear, orthogonal Rows/cols orthonormal $R^T R = I$ R(X+Y)=R(X)+R(Y)

Geometric Interpretation 3D Rotations

- Rows of matrix are 3 unit vectors of new coord frame
- Can construct rotation matrix from 3 orthonormal vectors

$$R_{uvw} = \begin{pmatrix} x_{u} & y_{u} & z_{u} \\ x_{v} & y_{v} & z_{v} \\ x_{w} & y_{w} & z_{w} \end{pmatrix} \quad u = x_{u}X + y_{u}Y + z_{u}Z$$

$$Rp = \begin{pmatrix} x_u & y_u & z_u \\ x_v & y_v & z_v \\ x_w & y_w & z_w \end{pmatrix} \begin{pmatrix} x_p \\ y_p \\ z_p \end{pmatrix} = ? \quad \begin{pmatrix} u \bullet p \\ v \bullet p \\ w \bullet p \end{pmatrix}$$

Geometric Interpretation 3D Rotations

$$Rp = \begin{pmatrix} x_u & y_u & z_u \\ x_v & y_v & z_v \\ x_w & y_w & z_w \end{pmatrix} \begin{pmatrix} x_p \\ y_p \\ z_p \end{pmatrix} = \begin{pmatrix} u \bullet p \\ v \bullet p \\ w \bullet p \end{pmatrix}$$

- Rows of matrix are 3 unit vectors of new coord frame
- Can construct rotation matrix from 3 orthonormal vectors
- Effectively, projections of point into new coord frame
- New coord frame uvw taken to cartesian components xyz
- Inverse or transpose takes xyz cartesian to uvw

Non-Commutativity

- Not Commutative (unlike in 2D)!!
- Rotate by x, then y is not same as y then x
- Order of applying rotations does matter
- Follows from matrix multiplication not commutative
 R1 * R2 is not the same as R2 * R1
- Demo: HW1, order of right or up will matter
 - simplestGlut.exe

Arbitrary rotation formula

- Rotate by an angle θ about arbitrary axis a
 - Not in book. Homework 1: must rotate eye, up direction
 - Somewhat mathematical derivation (not covered here except relatively vaguely), but useful formula
- Problem setup: Rotate vector b by θ about a
- Helpful to relate b to X, a to Z, verify does right thing
- For HW1, you probably just need final formula simplestGlut.exe

Axis-Angle formula

- Step 1: b has components parallel to a, perpendicular
 - Parallel component unchanged (rotating about an axis leaves that axis unchanged after rotation, e.g. rot about z)
- Step 2: Define c orthogonal to both a and b
 - Analogous to defining Y axis
 - Use cross products and matrix formula for that
- Step 3: With respect to the perpendicular comp of b
 - Cos θ of it remains unchanged
 - Sin θ of it projects onto vector **c**
 - Verify this is correct for rotating X about Z
 - Verify this is correct for θ as 0, 90 degrees

Axis-Angle: Putting it together

$$(b \setminus a)_{ROT} = (I_{3\times 3}\cos\theta - aa^T\cos\theta)b + (A^*\sin\theta)b$$
$$(b \to a)_{ROT} = (aa^T)b$$

$$R(a,\theta) = I_{3\times3}\cos\theta + aa^{T}(1-\cos\theta) + A^{*}\sin\theta$$
Unchanged Component Perpendicular (cosine) along a (rotated comp) (hence unchanged)

Axis-Angle: Putting it together

$$(b \setminus a)_{ROT} = (I_{3\times 3} \cos \theta - aa^T \cos \theta)b + (A^* \sin \theta)b$$
$$(b \to a)_{ROT} = (aa^T)b$$

$$R(a,\theta) = I_{3\times 3}\cos\theta + aa^{T}(1-\cos\theta) + A^{*}\sin\theta$$

$$R(a,\theta) = \cos\theta \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} + (1 - \cos\theta) \begin{pmatrix} x^2 & xy & xz \\ xy & y^2 & yz \\ xz & yz & z^2 \end{pmatrix} + \sin\theta \begin{pmatrix} 0 & -z & y \\ z & 0 & -x \\ -y & x & 0 \end{pmatrix}$$

(x y z) are cartesian components of a
