Complete the following problems. Be sure to show your work for partial credit.

1. Find a minimal Boolean equation for the following function. Remember to take advantage of the don't care entries.

| A | B | C | D | F |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | X |
| 0 | 0 | 0 | 1 | X |
| 0 | 0 | 1 | 0 | X |
| 0 | 0 | 1 | 1 | 0 |
| 0 | 1 | 0 | 0 | 0 |
| 0 | 1 | 0 | 1 | X |
| 0 | 1 | 1 | 0 | 0 |
| 0 | 1 | 1 | 1 | X |
| 1 | 0 | 0 | 0 | 1 |
| 1 | 0 | 0 | 1 | 0 |
| 1 | 0 | 1 | 0 | X |
| 1 | 0 | 1 | 1 | 1 |
| 1 | 1 | 0 | 0 | 1 |
| 1 | 1 | 0 | 1 | 1 |
| 1 | 1 | 1 | 0 | X |
| 1 | 1 | 1 | 1 | 1 |

2. A circuit has four inputs and two outputs. The inputs, $A_{3: 0}$, represent a number from 0 to 15 . Output P should be TRUE if the number is prime. Output D should be true if the number is divisible by 3 . Give simplified boolean equations for each output and sketch a circuit implementing the functions.
3. Minimize the following function using a Karnaugh map:
$F(A, B, C, D, E)=\Sigma m(1,5,8,10,12,13,14,15,17,21,24,26,31)$
4. You have learned how to use to plot the minterms of a function on a K-map. However, if a function, $F$, is expressed as a product of maxterms, you can still use K-maps to minimize it. Start by constructing the grid and labels as usual. Then, plot a 0 in the grid for each maxterm in $F$. You can then simplify $F$ by identifying prime implicants that "cover" these maxterms and taking their product. Apply this technique to find the minimimum POS expression for $F$, where $F=\Pi M(0,2,3,9,11,12,13,15)$.
