Using Modules

Import every name from a module:

```haskell
import Data.List

numUniques :: Eq a => [a] -> Int
numUniques = length . nub
```

In GHCi,

```
Prelude> :m + Data.List
Prelude Data.List> :m + Data.Map
Prelude Data.List Data.Map> :set prompt "ghci> "
ghci> -- under control
```

```
Prelude> :m + Data.List Data.Map
Prelude Data.List Data.Map> -- Multiple ones
```
import Data.List (nub, sort)  -- Only nub and sort
import Data.List hiding (nub, sort)  -- All but nub and sort
import qualified Data.List  -- Data.List.nub, etc.
import qualified Data.List as L  -- L.nub, L.sort, etc.
Prelude> :m + Data.List

Prelude Data.List> intersperse '*' "MASH"
"M*A*S*H"

Prelude Data.List> intercalate ',' ['Foo','Bar','Baz']
"Foo, Bar, Baz"

Prelude Data.List> transpose [[1,2,3],[4,5,6],[7,8,9]]
[[1,4,7],[2,5,8],[3,6,9]]

Prelude Data.List> concat ['PFP ','is ','fun']
"PFP is fun"

Prelude Data.List> concatMap (replicate 3) [1..3]
[1,1,1,2,2,2,3,3,3]
Prelude Data.List> and [True, False, True]
False
-- and = foldr (&&) True
Prelude Data.List> and [True, True]
True

Prelude Data.List> or [True, False, True]
True
-- or = foldl (||) False
Prelude Data.List> any (==4) [1..5]
True
-- any p = or . map p

Prelude Data.List> all (>4) [5..10]
True
-- all p = and . map p
Prelude Data.List> all (<=4) [5..10]
False
Prelude Data.List> `take 5 $ iterate (*2) 1`  
[1,2,4,8,16]

Prelude Data.List> `splitAt 3 "pfprocks"`  
("pfp","rocks")

Prelude Data.List> `takeWhile (<10) [1..]`  
[1,2,3,4,5,6,7,8,9]  

-- Prefix of list

Prelude Data.List> `dropWhile (<5) [1..10]`  
[5,6,7,8,9,10]  

-- Suffix of list

Prelude Data.List> `span (<5) [1..10]`  
([[1,2,3,4],[5,6,7,8,9,10]])  

-- Prefix/suffix split
Prelude Data.List> sort [8,5,3,2,1,6,4,2]
[1,2,2,3,4,5,6,8]

Prelude Data.List> group [1,1,1,2,2,1,1,1,1,5,5,4,3,3]
[[1,1,1],[2,2],[1,1,1,1],[5,5],[4],[3,3]]

Prelude Data.List> maxRun = maximum . map length . group
Prelude Data.List> maxRun [1,1,1,2,2,1,1,1,1,5,5,4,3,3]
4

Prelude Data.List> inits "whoa!"
["","w","wh","who","whoa","whoa!"

Prelude Data.List> tails "whoa!"
["whoa!","hoa!","oa!","a!","!",""

Prelude Data.List> let s = "whoa" in zip (inits s) (tails s)
["","whoa"),("w","hoa"),("wh","oa"),("who","a"),("whoa",""
Searching Lists

isPrefixOf :: Eq a => [a] -> [a] -> Bool
isPrefixOf [] _ = True
isPrefixOf _ [] = False
isPrefixOf (x:xs) (y:ys) = x == y && isPrefixOf xs ys

Prelude Data.List> "PFP" `isPrefixOf` "PFP Rocks!"
True
Prelude Data.List> "PFP" `isPrefixOf` "PHP Rocks!"
False
Prelude Data.List> :set prompt "> "
> search needle haystack = any (isPrefixOf needle) (tails haystack)
> search "fun" "PFP is fun, dontcha know"
True
> search "fun" "Columbia"
False

Data.List calls it isInfixOf instead of search. There is also isSuffixOf
Partition and Quicksort Revisited

Prelude Data.List> msg = "He Is Daring, Dumb, and Educated, Nancy"

Prelude Data.List> partition (\elem ['A'..'Z']) msg
("HIDDEN","e s aring, umb, and ducated, ancy")

import Data.List ( partition )

quicksort :: Ord a => [a] -> [a]
quicksort [] = []
quicksort (p:xs) = quicksort prefix ++ [p] ++ quicksort suffix
    where (prefix,suffix) = partition (<p) xs

*Main> :l quicksort3
[1 of 1] Compiling Main ( quicksort3.hs, interpreted )
Ok, one module loaded.
*Main> quicksort "the quick brown fox jumps over the lazy dog"
" abcdeefghhijklmnoooppqrrsttuuvwxyz"
Lists as Text

Prelude> lines "first
second
third
fourth"
["first","second","third","fourth"]

Prelude> unlines ["one","two","three"]
"one\ntwo\ nthree\n"

Prelude> words "The Quick Brown Fox Jumps"
["The","Quick","Brown","Fox","Jumps"]

Prelude> unwords ["My","gosh","it's","full","of","stars"]
"My gosh it's full of stars"
Lists as Sets: Assumes Unique But Unordered

Prelude Data.List> nub [1,3,2,4,3,2,1,2,3,4,3,2,1] [1,3,2,4] -- Duplicates removed, unordered

Prelude Data.List> nub "the quick brown fox jumps over the lazy dog" "the quickbrownfxjmpsvlazydg"

Prelude Data.List> delete 'e' "Stephen" "Stphen" -- Delete the first matching element

Prelude Data.List> ([1..10] ++ [1..3]) \ [2,5,9] [1,3,4,6,7,8,10,1,2,3] -- List difference: delete first matching

Prelude Data.List> "the quick brown fox" `union` ['a'..'z'] "the quick brown foxadgjlmpsvyz"

Prelude Data.List> "the quick brown fox" `intersect` ['a'..'m'] "heickbf"

Prelude Data.List> insert 'p' "almost" "almopst" -- To last position where it's <=; maintains sorted order
genericLength :: Num i => [a] -> i
genericTake :: Integral i => i -> [a] -> [a]
genericDrop :: Integral i => i -> [a] -> [a]
genericSplitAt :: Integral i => i -> [a] -> ([a], [a])
genericIndex :: Integral i => [a] -> i -> a
genericReplicate :: Integral i => [a] -> i -> [a]

nubBy :: (a -> a -> Bool) -> [a] -> [a]
deleteBy :: (a -> a -> Bool) -> a -> [a] -> [a]
deleteFirstsBy :: (a -> a -> Bool) -> [a] -> [a] -> [a]
unionBy :: (a -> a -> Bool) -> [a] -> [a] -> [a]
intersectBy :: (a -> a -> Bool) -> [a] -> [a] -> [a]
groupBy :: (a -> a -> Bool) -> [a] -> [[a]]

sortBy :: (a -> a -> Ordering) -> [a] -> [a]
insertBy :: (a -> a -> Ordering) -> a -> [a] -> [a]
maximumBy :: Foldable t => (a -> a -> Ordering) -> t a -> a
minimumBy :: Foldable t => (a -> a -> Ordering) -> t a -> a
Data.Char: Character Type Predicates

\[\text{isAscii, isLatin1, isControl, isAsciiUpper, isAsciiLower, isPrint, isSpace, isUpper, isLower, isAlpha, isDigit, isOctDigit, isHexDigit, isAlphaNum, isPunctuation, isSymbol} : : \text{Char} \rightarrow \text{Bool}\]

Prelude Data.Char> \text{all isHexDigit } "18deadBEEF"
True
Prelude Data.Char> \text{all isHexDigit } "gosh"
False
Prelude Data.Char> \text{map generalCategory } " \t\n\!A9?\""
[\text{Space, Control, Control, UppercaseLetter, DecimalNumber, OtherPunctuation, MathSymbol}]
Data.Char: Conversion Functions

```haskell
Prelude Data.Char> map toUpper "the quick brown fox"
"THE QUICK BROWN FOX"

Prelude Data.Char> map toLower "THE QUICK Brown FoX"
"the quick brown fox"

Prelude Data.Char> map digitToInt "09afBC"
[0,9,10,15,11,12]   -- Hex digits allowed

Prelude Data.Char> map intToDigit [4,2,10,15]
"42af"   -- Inverse of digitToInt

Prelude Data.Char> map ord "!ABab"
[32,33,65,66,97,98]   -- ASCII/Unicode values

"Get Bent"   -- Inverse of ord
```
Association Lists: Slow, Straightforward

```haskell
phoneBook =
[("Jenny","867–5309")
 ,("Morris","777–9311")
 ,("Alessia","273–8255")
 ,("Tina","606–0842")
 ,("Alicia","489–4608")
 ,("Glenn","736–5000")
]

find :: Eq k => k -> [(k, v)] -> v
find k = snd . head . filter (==k) . fst

*Main> find "Alicia" phoneBook
"489–4608" -- Alicia is one of the keys
*Main> find "Jenny" phoneBook
"867–5309"
*Main> find "Marty" phoneBook
*** Exception: Prelude.head: empty list
```
Prelude> import qualified Data.Map as Map

Prelude Map> :t Map.fromList
Map.fromList :: Ord k => [(k, a)] -> Map.Map k a -- Ordered keys

Prelude Map> Map.fromList ["Jenny","837-5306"],("Alicia","489-4608")
