C-like language designed to bridge the gap between Java and procedural system programming in COMS 3157 by providing primitive socket-networking functionality with minimal overhead to explicitly manager resources utilized by strings and sockets.
1 Introduction

COMS 3157 serves as the bridge between object oriented introductory coursework and the world of system programming through the lens of C within Columbia’s CS curriculum. The goal of ezap is to provide abstractions which while different then the syntax employed in Java allow for the creation of sockets in a manner that is more familiar than the purely procedural approach C takes which requires a working understanding of lower-level concepts such as memory management and accessing variables through pointers. In essence the goal of ezap is to motivate the course by allowing the students to code up constructs similar to the later deliverables in the course and excite them about learning the lower level language constructs that allow the larger deliverables to be feasible later on in the course.

2 Development Plan

The intent of motivating the language within the constructs of a course is to define narrowly the functionality I wish to achieve and build upon. Given the timeline of the project the codebase will be built on top of MicroC such that the entire time of the project is not spent frantically attempting to achieve feature parity with MicroC before preforming original, interesting work.
3 Language Features

The syntax of *ezap* while align closely with MicroC and will have a superset of MicroC’s language features. The critical feature to the language is its context manager which is similar to the context manager found in Python.

3.1 DATA TYPES

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Size</th>
<th>Declaration</th>
</tr>
</thead>
<tbody>
<tr>
<td>int</td>
<td>primitive integer</td>
<td>4-bytes</td>
<td>int x = 4;</td>
</tr>
<tr>
<td>float</td>
<td>primitive float</td>
<td>8-bytes</td>
<td>float f = 7.5;</td>
</tr>
<tr>
<td>bool</td>
<td>primitive boolean</td>
<td>1-byte</td>
<td>bool x = true;</td>
</tr>
<tr>
<td>string</td>
<td>string literal array of chars</td>
<td>dynamic</td>
<td>str s = &quot;hello world&quot;;</td>
</tr>
<tr>
<td>socket</td>
<td>socket for primitive TCP networking</td>
<td>dynamic</td>
<td>socket s = ['c', 1300];</td>
</tr>
<tr>
<td>char</td>
<td>primitive ASCII char</td>
<td>1-byte</td>
<td>char c = 'c';</td>
</tr>
</tbody>
</table>

3.2 KEYWORDS

<table>
<thead>
<tr>
<th>Name</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>if</td>
<td>conditional test</td>
</tr>
<tr>
<td>else</td>
<td>alternative if nearest conditional test fails</td>
</tr>
<tr>
<td>while</td>
<td>loop that checks conditional before each iterative execution</td>
</tr>
<tr>
<td>for</td>
<td>loop that checks conditional execution before each iteration</td>
</tr>
<tr>
<td>return</td>
<td>return the evaluated expression to the caller</td>
</tr>
</tbody>
</table>

4 Goals

Given the compressed timeline I have narrowed my goals for the project.

1. Build in socket language features that allow for basic chatting
2. Build in socket language features that automatically allocate/deallocate the resources
   - A natural way to display this would be with the messaging programming such that upon receiving a termination "message" a control flow loop for listening is exited and resources are deallocated from the socket accordingly
3. If time permits building in a full on client/server example would naturally be desirable

5 Socket Data type

5.1 Socket Creation

socket S = [char mode, int port];
- creates a new socket
- handles "memsetting" and configuring low-level structs used in configuring the sockets
- allows to be configured as a **client** or **server**. This piece of metadata will be tracked to make sure that calls for each socket are appropriate.
- handles binding to the specified port

5.2 Socket Connection

void connect(socket s, str address, int remoteport);
- handles configuring lower level structs about the remote address
- used only by "client" sockets server sockets are automatically setup to begin listing and accepting at the port passed in to the creation of a new socket
- in the case of failure the program will simply terminate
5.3 Sending/Receiving over Sockets

```c
str receive(socket s);
```

- receive will simply block and return back to the caller an immutable, null-terminated, string literal that was received over the socket.
- the buffering implementation will not be visible to the ezap programmer

```c
void send(socket s, str data);
```

- a string will be sent over the socket and the function will return void. In the case of an error called by the underlying call to send() in the C standard library runtime-error messages will be printed out to the stdout.

5.4 Closure of Sockets

- Sockets will be closed as soon as they leave the scope in which they were created. All necessary dynamic memory cleanup will be done on behalf of the programmer and the socket will be closed without an explicit call to any sort of a "close" function as would be necessary when operating with true "C" sockets.

I have included a hand-written diagram for the constructs I have discussed below.

The end product reflects the right hand side of the diagram. The time was primarily spent on adding support for strings as well as the context manager instead of beefing up the standard library at the expense of these language features such that server side operations are supported. This highlights a somewhat low-hanging fruit for future opportunities to develop the language.
6 Operators

ezap will leverage all of the Micro C operators with the addition of an ==, @, +=, + operators for Strings.

7 Compiler Overview

At the top-level of the ezap directory type make. This will build the ./ezap.exe compiler binary by leveraging dune in the src folder as well as an additional Makefile in the stdlib folder to compile and link in the standard library. The compiler executable will be symlinked to the top-level of the directory for easy access and the regression test suite will run. If you just wish to generate the compiler without running the regression test suite simply run make compiler.

The ezap compiler makes passes at a source file repeatedly before outputting an LLVM module to stdout. If you wish to compile a source file all the way down to a binary file leverage the compiler.sh shell script with usage:

./compiler.sh source.ez

The tooling for the ezap compiler is nearly identical to MicroC and was developed inside of an Ubuntu 20.04.3 virtual machine instance. Notable differences include that the OCaml version is 4.08.1, the OPam LLVM version is 13.0.0 as well as the system-level LLVM version. For straightforward installation instructions please refer to the README available on my Github in order to get started with the ezap language.
LANGUAGE REFERENCE MANUAL
8 Structure of the LRM

This LRM will seek to primarily highlight the additions/changes to the MicroC language instead of rehashing the syntax and semantics of the MicroC language except when it is illuminating to do so.

9 Lexical Conventions

9.1 Reserved Keywords

ezap has the following reserved keywords across its control flow and types:

```plaintext
if, else, for, while, int, float, bool, str, socket, char, return, as, with
```

ezap has the following built-in functions with reserved keywords

```plaintext
recv, send, printb, prints, print, printf, read, connect
```

9.2 Comments

Comments in ezap allow for multi-line comments and add in support for single-line comments. Single line comments are initiated with an opening // and are terminated upon reaching either newline or newline with a carriage return.

```plaintext
/* Multi-line comments can continue
over multiple lines */

//Single line comments can only span one line
```

9.3 Chars

ezap adds in support for ASCII chars. There are chars which are not printable but can still be used by preceding the char with a . The following escape sequences are supported by ezap.

```
'\n' '\t' '\r' '\b' '\f' '\\'
```

An ezap char consists of exactly one ASCII char no more no less. Chars are preceded with and followed by an apostrophe.

9.4 Strings

Strings are a heap-allocated array of null-terminated ASCII characters. They support the same escape sequences as singular chars. Strings begin and end with a . The String data type in ezap is strictly immutable. This means that the built in operations for Strings which would manipulate the underlying structure instead copy any would-be modification to a new buffer and return this new heap-allocated string to the user.

9.5 Socket

Sockets are stack-allocated structs with a file descriptor associated with the socket not visible to the user. A socket consists of a char which specifies the mode of the socket (either client or server) as well as an int which defines the port number the socket will be bound to when it is created. The syntax for defining a socket is:

9.6 Punctuation

ezap adds in the use of left and right "square" brackets during the definition of a struct literal these brackets are as follows [ ]
9.7 Operators

ezap adds in support for the following operators for the String data type. These operators are

\&, +, +=, ==

10 Syntax

10.1 Program Structure

The program structure of an ezap program is identical to that of MicroC. It is notable that variables must be declared at
the top-level of either a file or function before they are defined.

10.2 Functions

ezap programs require that a \texttt{main} function is defined. In addition to this mandatory function there is also requirement that
each function which returns a non-void type actually return said non-void type. This is different than in C where the result
is simply undefined behavior.

\begin{verbatim}
int main(){
    int i;
    i = 5;
    //syntax error must return an int
}
\end{verbatim}

\begin{verbatim}
int main(){
    int i;
    i = 5;
    return i;
    //compiles -- main returns an int as it says it will in its definition
}
\end{verbatim}

\begin{verbatim}
void main(){
    int i;
    i = 5;
    //compiles -- void functions do not have to have a return statement
}
\end{verbatim}

11 Deep-Dive on String Operations

11.1 Charat

The charat operator takes in a string literal or an identifier which maps to a string as well as an integer which specifies the
index of the string to return with the first char of a string being indexed from 0. The syntax for the operator is:

\texttt{string@int}

In the event that operators do not match the specifications an error is thrown at compile-time. It is not possible to deduce
at compile time the value of the index on the RHS so we throw an error at run-time in the event that the index specified is
out of the bounds of the length of the string passed on the LHS.
11.2 Equality

The equality operator takes in two strings and returns whether the lexicographical contents of the strings are identical (not their locations in memory). In the case that the strings are identical a boolean literal with value true is returned. In the event the strings are not equivalent a boolean literal equating to false is returned to the user. The syntax for the equality operator on strings is as follows.

```plaintext
str s1;
str s2;
bool cmp;
s1 = "ez";
s2 = "ap";
//will return false boolean literal
cmp = s1 == s2
```

11.3 Concatenation

The concatenation operator is +. Concatenation takes in two strings on either side of the operator. Neither of the underlying strings is modified due to the strict immutability of the string type discussed earlier. Instead a new heap-allocated string is returned back to the user that is the result of placing the string on the LHS first and then following it with the string on the RHS. The syntax for the concatenation operator is as follows.

```plaintext
str s1;
str s2;
str s3;
s1 = "hello ";
s2 = "world";
//s3 will be assigned "hello world"
s3 = s1 + s2;
```

11.4 Plus Assignment

Plus assignment leverages the concatenation routine and desugars to s1 = s1 + s2; in the event that s1 += s2; is present in the program and s1 and s2 are both strings. The operation returns a new heap allocated string and assigns it to s1. The syntax for the plus assignment operator is as follows.

```plaintext
str s1;
str s2;
s1 = "hello";
s2 = " world";
//the expression assigns "hello world" to s1
s1 += s2;
```

11.5 Precedence of String Operators

1. Plus assignment sits at the lowest level of precedence among the string operators and at the same level of regular assignment. It is a right-associative operator.

2. Equality is already an operator present in the grammar and so its precedence was not modified. It is a left associative operator.

3. Concatenation is already present in the grammar in the form of the "+" operator for ints and floats. Its precedence is unchanged and it is a left-associative operator.

4. Charat sits at the same level of precedence as "+" and "/." binary operators. It is a left associative operator.
12 Built-in Socket Functions

12.1 Connect

When a socket is specified via the form [sock’type, port’number] a file descriptor gets associated with the socket. In addition the socket is bound to the port number specified in port’number. If the port’number is invalid an exception will be thrown at run-time and execution will terminate. In addition there is the connect function specified by.

```c
void connect(socket s, str address, int port);
```

In the event that the address or port number are invalid an exception is thrown at run-time. Otherwise a transient TCP connection is established between the socket s and the remote server at address, address listening on port, port.

12.2 Send

The send call takes a connected socket and attempts to send a string over the connection. The declaration of the send function is as follows:

```c
void send(socket s, str data);
```

In the event that the socket is not connected or the send of the data is unsuccessful an error is thrown at run-time.

12.3 Recv

The recv call takes a connected socket and attempts to receive a string over the connection until either EOF is reached or the buffer overflows. The underlying buffer is of size 16k but only a string of the size of the length of the received string is returned to the user. If this is unsatisfactory it is suggested to pursue alternative methods for receiving from a connected socket. In the event a string is successfully received the string is returned to the user. The declaration of the receive call is as follows.

```c
str recv(socket s);
```

13 Additional Built-in Functions

13.1 Print Functions

There are print functions for printing both strings and chars they are called prints and printc respectively and their syntax mirrors that of the print and printf functions. Their definitions are as follows.

```c
void prints(str s);
void printc(char c);
```

13.2 Read

Read reads stdin until either a newline or EOF is reached. The underlying buffer is of size 16K but only a string with size of the data read is allocated and returned to the user. The declaration of read is as follows:

```c
str read();
```
14 Context Manager

The context manager is a statement in the ezap language which abstracts away resource management of strings and sockets. Context Managers can be nested within one another and contain any additional control flow statements inside of them. The syntax for a context manager is as follows:

```
str s;
socket sock;
with s as ("hello"){
    //body statements
}
with sock as ("[c',1300]"{
    //body statements
}
```

More generally context managers are specified by: `with expr1 as (expr2) stmt`. `expr1` must evaluate to an `id` in order for the syntax of the context manager to be valid. `expr2` must evaluate to either a `string` or a `socket`. Finally there is no casting between strings and sockets. The data type associated with the id of `expr1` must match the data type `expr2` evaluates to. When control moves past the context manager’s scope in the event the type of `expr2` is a string the heap allocation is freed and no leak will occur. In the event the type of `expr2` is a socket the file descriptor associated with the socket will be closed for both reading and writing.

Context managers do not use-defined functions for cleaning up resources held by `expr1` and as a result only support string and socket data types. Additionally the `id` which `expr1` evaluates to cannot be reassigned in the case of both a socket and string. This mirrors the PEP 343 specification of Python’s `with` statement.

15 Demo Program

A demo program is provided below which leverages several of the features of the ezap language described in this language reference manual. It offers an opportunity to highlight style for coding in ezap. The one notable difference between writing standard C-style code and ezap code is the indentation of context manager statements. Nested context managers do not get indented further. It is only in the event of an expression or statement that is not a context manager that indentation continues. This allows the programmer to easily visualize the resources being managed by context managers and what scope they are bound to.

```
//a simple chat application that interfaces with netcat
int main(){
    //declarations
    socket s;
    str terminate;
    char c;
    bool b;
    int cmp;
    str inbound;
    str outbound;
    str addr;
    cmp = 1;
    with s as ("[c',1304]"{
        with addr as ("127.0.0.1"){
            connect(s,addr, 1250);
        }
        with terminate as ("end\n"){
            while(cmp == 1){
                with outbound as (read()){
                    send(s, outbound);
                }
                with inbound as (recv(s)){
                    prints(inbound);
                }
            }
        }
    }
}
```
b = ( inbound == terminate);
if(b == false){
    cmp = 1;
} else{
    cmp = 0;
}
}
}
}
}
return 0;
PROJECT PLAN
16 Project Plan

16.1 Planning/Development Process

Planning occurred during finals week of Fall 2021. I opted towards motivating the language with socket program and TA John Hui met in order to discuss the stages of development. John suggested developing support for strings first as way to become familiar with implementing additional features to the MicroC code base. After this I focused intently on developing the context manager for strings. Next the socket data type was created and I focused on implementing this structure and manipulating the underlying pointer to the socket using the OCaml LLVM bindings. Finally, I wrote the socket standard library in C.

16.2 Style Guide

The style of the code base is intended to mirror the conventions used in the MicroC code base.
16.3 Project Timeline/Log

commit bcd3b91ba3f13eb2714b3d74c7fe7f0f16f6e46d
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Tue Jan 4 16:14:07 2022 −0800

renaming test1.sh to compile.sh to be consistent with README

commit 41084098dfae08853b7cd1b7c9afca896d632079
Merge: bd1ea45 5d5d418
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Tue Jan 4 16:11:55 2022 −0800

Merge branch 'main' of github.com:RyanLee64/ez–AP into main

commit 5d5d418427dc73298013992ae67d69b615c7e142
Author: Ryan Lee <65369992+RyanLee64@users.noreply.github.com>
Date: Tue Jan 4 18:09:35 2022 −0600

Added using the ezap compiler section to README

commit c9ef45c7a964e75663b0c2cf7e84d6c988a67dce
Author: Ryan Lee <65369992+RyanLee64@users.noreply.github.com>
Date: Tue Jan 4 18:01:46 2022 −0600

Final version of README

commit 51bea30bf5f7a04561e2b0047c23a447c292f97
Author: Ryan Lee <65369992+RyanLee64@users.noreply.github.com>
Date: Tue Jan 4 17:31:46 2022 −0600

Update README.md

commit 7b740041f2953d89bd99fefd2e818fbfc12e94c
Author: Ryan Lee <65369992+RyanLee64@users.noreply.github.com>
Date: Tue Jan 4 17:30:01 2022 −0600

Update README.md

commit d1069d664710b8d880d63824ad88030183c1b863
Author: Ryan Lee <65369992+RyanLee64@users.noreply.github.com>
Date: Tue Jan 4 17:29:42 2022 −0600

Update README.md

commit bd1ea456345eddcea345320e0eeb7b983ae5b363
Merge: 315b455 c8e28da
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Tue Jan 4 15:03:29 2022 −0800

Merge branch 'main' of github.com:RyanLee64/ez–AP into main

commit c8e28dadf5bd2b644b329e99132c93f0a613a56b
Author: Ryan Lee <65369992+RyanLee64@users.noreply.github.com>
Date: Tue Jan 4 17:01:01 2022 −0600

updated testall.sh to access lli/l1c
rename complete compilation shell script to match final report

top−level Makefile target name tweaks

temporary commit of demo files for safekeeping — will remove if project spec requires it

context manager fully compatible with closing sockets — source is ready for demo

source code cleanup and working demo program ready on local machine for tomorrow — semantic check for sockets in context manager statements

reading from stdin working

recv working for sockets

adding support for non−void return types from built−in functions

send working for sockets

connect up and running for sockets
commit 9e9175cd1474a4a31333cbb275a1a5fda30cfe63
Author: Ryan Lee <dbl2127@columbia.edu>

charat operator with heap allocation/leak
commit 3bb6469447e7ff329733dc8f762695f496666be12
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Tue Dec 28 11:51:38 2021 -0800

+= operator for strings tested and working with leaks
commit d3bf1a073a54dbb8fe23b9ea8651037c92a78347
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Tue Dec 28 08:50:38 2021 -0800

Makefile tweak to remove ezap.exe on new call
commit cb928a425d4a789f4af000d2fdfc82b937b1dfdf
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Tue Dec 28 08:50:08 2021 -0800

test cases for new return semantics
commit fa436935e0be134bd0fa673698ade0918f625cb0
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Mon Dec 27 11:18:31 2021 -0800

added semantic check to make sure return types match up and that a return statement is present
commit 4a540bcc40d0e43a5ce855bc3b7e312109eed54f8
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Sat Dec 25 21:27:44 2021 -0800

removing printbig.c from top level directory
commit f73057493ba3ba23ba34442108e21413b74f6cbb58d
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Sat Dec 25 21:04:10 2021 -0800

renamed .mc tests to .ez and added todays features to regression test suite
commit 67b3dfd4309e6d2769194e9dee5aa32c594b057f
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Sat Dec 25 20:45:05 2021 -0800

working hello world with + as strcat operator
commit 1be2902102f3b8bc72f57315aaed240dec135d9b
working heap allocate strings with printing down to .exe with some makefile cleanup
commit c772c009aa5d04445006ec27b2d2193109c41f9c
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Sat Dec 25 19:54:31 2021 -0800

working str assignment
commit e8fd39f825f01cc620c8013e1a2958ca8b8e3f1c
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Sat Dec 25 07:32:58 2021 -0800

end to end working microc fusion with scanner
commit 23241b957d3abd295419bd75236ed054ed9e8304
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Fri Dec 24 09:39:36 2021 -0800

parser added just for setup
commit bac9b57ff5b8096dbd3ded86b45bae00b7c674de
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Sun Dec 19 16:05:32 2021 -0800

initial dunamefile
commit c40bfa94c1cadc38dd0d34ee74fba5e932e69f53
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Sun Dec 19 16:05:12 2021 -0800

started on scanner
commit 5f938426de3fe930bec2aae7d9b0373e2b1c1f4d
Author: Ryan Lee <dbl2127@columbia.edu>
Date: Sun Dec 19 15:00:10 2021 -0800

first commit
16.4 Roles/Environment

The development environment was hosted on an Ubuntu VM run through VMWare on a Intel based Macbook Pro. The editor of choice was VSCode. Within VSCode I made use of the OCaml and Reason IDE plugin which interfaces with Merlin as well as OCaml’s LSP server. Makefile and Dune were utilized to build the code base. Finally, valgrind was used to check for leaking memory. Git and Github were used for version control and source code hosting respectively. The code base is written in OCaml for the compiler, C for the standard library, Makefile/Dune for build instructions and Shell script for automating compilation of source code/running the test suite.

Naturally I fulfilled all of the responsibilities with the help and guidance of TA John Hui to orient my language towards some attainable goals.
ARCHITECTURAL DESIGN
ezap.ml sequentially calls the phases of the block diagram described above. It calls the lexer to generate a stream of tokens from the source file as input. This list is passed to the grammar output by ocamlyacc which creates an AST tree corresponding to the syntax recognized by the stream of tokens via an LR(1) parsing algorithm. This AST is then passed to the Static Semantic checker which associates a type with each expression. This "SAST" is passed as a list of globals and functions to the codegen.ml file which generates an LLVM module using the OCaml MOE bindings. When using compiler.sh this is passed to llc which generates assembly code for the architecture of the computer the code is running on. Finally this assembly file is run through the system’s c compiler and linked with the standard library for the ezap language. The final output is a binary executable.
TESTING PLAN
19 Representative Programs

19.1 Simple Chat

SOURCE

```c
// simple chat application that interfaces with netcat
int main() {
    // declarations
    socket s;
    str terminate;
    char c;
    bool b;
    int cmp;
    str inbound;
    str outbound;
    str addr;

    cmp = 1;

    with s as ([c, 1304]) {
        with addr as ("127.0.0.1") {
            connect(s, addr, 1250);

            with terminate as ("end\n") {
                while (cmp == 1) {
                    with outbound as (read()) {
                        send(s, outbound);
                    }
                    with inbound as (recv(s)) {
                        prints(inbound);
                        b = (inbound == terminate);
                        if (b == false) {
                            cmp = 1;
                        }
                    }
                }
                else {
                    cmp = 0;
                }
            }
        }
    }

    return 0;
}
```

20 Test Suites

The testing process consisted of adding one fail and one successful test for each feature implemented into the language. In addition larger more complex source code was passed to the language which was designed to interweave different language features in order to make sure no undesirable side effects were introduced.

The testall.sh script was modified and used for the purposes of the project. In addition the compiler.sh script was used to test individual language features as they were built up.
LESSONS LEARNED
21 Advice and Such

- Above all else communication is paramount in a semester long group project. This is a different flavor than something like a "lab" or semester long project with tight specifications broken into very small chunks. This affords you the freedom to design a language with all the features you want but also naturally the flexibility and only having one firm due date/deliverable introduces opportunities to err farther off course than would be possible during smaller projects.

- If you are unfamiliar with OCaml/functional programming in general like I was I would suggest this playlist.

- Read up on LLVM IR/Static Single Assignment ahead of lecture. This is the target representation of your compiler so you are going to want to be very familiar with and start visualizing how to implementing your language constructs within this IR.

- Ask for help as early as you think you even might need it. The teaching staff is there to support you and you can do this so long as you leverage the support system in place and work diligently.
