Threats

Threats

Assets

Vulnerabilities

Protecting a Network "The property that information is not made available or disclosed to unauthorized individuals, entities, or processes [i.e., to any unauthorized system entity]." [definitions from RFC 2828]

Not the same as *privacy*.

- **Privacy**: "The right of an entity (normally a person), acting in its own behalf, to determine the degree to which it will interact with its environment, including the degree to which the entity is willing to share information about itself with others."
- Privacy is a reason for confidentiality

Integrity

Terminology What is Security? What is Security? Confidentiality Integrity Availability More Definitions Vulnerabilities Threats

Assets

Vulnerabilities

Protecting a Network

data integrity: "The property that data has not been changed, destroyed, or lost in an unauthorized or accidental manner."
system integrity: "The quality that a system has when it can perform its intended function in a unimpaired manner, free from deliberate or inadvertent unauthorized manipulation."
Often of more commercial interest than confidentiality

Availability

Terminology What is Security?

What is Security?

Confidentiality Integrity

Availability

More Definitions Vulnerabilities Threats

Threats

Assets

Vulnerabilities

Protecting a Network "The property of a system or a system resource being accessible and usable upon demand by an authorized system entity, according to performance specifications for the system; i.e., a system is available if it provides services according to the system design whenever users request them."

Turning off a computer provides confidentiality and integrity, but hurts availability...

Denial of service attacks are direct assaults on availability

- Host Vulnerabilities Network Vulnerabilities Different Layers ARP Spoofing Normal TCP 3-Way Handshake Sequence-Number Guessing Attack Complexities

Protecting a Network

- We are dealing with the host world and the network world
- We need to protect against both classes of vulnerability
- Techniques differ

Host Vulnerabilities

Terminology Threats Assets Vulnerabilities The Dichotomy Host Vulnerabilities Network **Vulnerabilities Different Layers ARP** Spoofing Normal TCP 3-Way Handshake Sequence-Number **Guessing Attack** Complexities Protecting a Network

- Our goal: keeping the bad guy from penetrating the networked host (generally via a buggy application) If a penetrated application is used to break host security, it's probably an OS and application security issue If the application itself can be tricked into doing nasty things, it's probably a network
- security problem
- No, the categories aren't neat and clean

Network Vulnerabilities

Terminology Threats Assets Vulnerabilities The Dichotomy Host Vulnerabilities Network Vulnerabilities Different Layers ARP Spoofing Normal TCP 3-Way Handshake Sequence-Number Guessing Attack Complexities

Vulnerabilities

The Dichotomy

Host Vulnerabilities Network

Vulnerabilities

Different Layers

ARP Spoofing

Normal TCP 3-Way Handshake Sequence-Number Guessing Attack Complexities

Protecting a Network ARP is used to map IP addresses into Ethernet addresss:

arp who-has chadash.cs.columbia.edu tell
 gg1.cs.columbia.edu
arp reply chadash.cs.columbia.edu is-at
 00:20:78:1e:1f:ef

Another machine can reply; first reply generally wins:

00:11:50:28:b3:a8 on ath0 tried to overwrite arp info for 192.168.2.1 on wm0

Terminology

Threats

Assets

Vulnerabilities The Dichotomy Host Vulnerabilities Network Vulnerabilities Different Layers ARP Spoofing Normal TCP 3-Way Handshake Sequence-Number Guessing Attack Complexities

Protecting a Network

Normal TCP 3-Way Handshake

A client C tries to contact a server S:

 $C \rightarrow S$: $SYN(ISN_C)$ $S \rightarrow C$: $SYN(ISN_S), ACK(ISN_C)$ $C \rightarrow S$: $ACK(ISN_S)$ $C \rightarrow S$: data

In older TCPs, the ISN (Initial Sequence Number) is incremented by a constant amount k after each connection and every half-second.

Terminology

Threats

Assets

Vulnerabilities The Dichotomy Host Vulnerabilities Network Vulnerabilities Different Layers ARP Spoofing Normal TCP 3-Way Handshake Sequence-Number Guessing Attack Complexities

Protecting a Network

Sequence-Number Guessing Attack

X opens a legitimate connection to S to learn ISN_S

 $X \to S : SYN(\mathsf{ISN}_X)$ $S \to X : SYN(\mathsf{ISN}_S), ACK(\mathsf{ISN}_X)$

X impersonates T:

$$\begin{split} X &\to S : SYN(\mathsf{ISN}_X), SRC = T \\ S &\to T : SYN(\mathsf{ISN}_S + k), ACK(\mathsf{ISN}_X) \\ X &\to S : ACK(\mathsf{ISN}_S + k), SRC = T \\ X &\to S : ACK(\mathsf{ISN}_S + k), SRC = T, \mathsf{nasty-data} \end{split}$$

Deploy protective measures

Protections

Analysis

Protections Don't Forget the Human Element

Replace vulnerable mechanisms by strong ones Example: don't use address-based authentication; use cryptography Use filters or firewalls to limit access to important but insecure services Example: the CS department does not permit outside access to Windows file-sharing ports Use procedural mechanims as a last resort Example: there's no way to block ARP-spoofing, so you have to keep would-be spoofers off your LAN — the attack can't be launched remotely

Don't Forget the Human Element

Terminology Threats Assets Vulnerabilities Protecting a Network Analysis Protections Don't Forget the Human Element

"Humans are incapable of securely storing" high-quality cryptographic keys, and they have unacceptable speed and accuracy when performing cryptographic operations. They are also large, expensive to maintain, difficult to manage, and they pollute the environment. It is astonishing that these devices continue to be manufactured and deployed, but they are sufficiently pervasive that we must design our protocols around their limitations." Kaufman et al.
